C/O FAO Representative, P O Box No 1501, Colombo Sri Lanka.

PREFACE

The expression Fish Aggregating Device -- FAO -- can be used to describe any method, object or construction used to facilitate the harvesting of the fish by attracting and thus aggregating them. Fishermen in many countries have long been aware of and utilised the fact that old branches, logs, leaves, boats etc. aggregate fish. At present techniques to attract fish - mainly tunes - to rafts are being developed in several areas.

The titles listed in this document are either papers received in the course of collecting information on FAO's for a review on the subject or references from secondary sources. An asterisk against an entry indicates its availability in the BOBP Library.

Since all titles listed have not been reviewed, it is difficult to assess their relevance, and this list does not claim to be either complete or comprehensive. However, it is hoped that this document will encourage those interested to further and deepen knowledge about FAO's.

A list of institutions who have engaged in work on FAO's is also included.

The publication of this information paper is an activity of the Bay of Bengal programme small-scale fisheries development, referred to in brief as the Bay of Bengal programme (BOBP). The BOBP seeks to develop and concentrate appropriate technologies and methodologies in several areas of small-scale fisheries - such as fishing craft, fishing gear, fish handling and utilisation, coastal aquaculture. Its goals are to improve the conditions of small-scale fisherfolk and the supply of fish from the small-scale sector in five countries that border the Bay of Bengal -- Bangladesh, India, Malaysia, Sri Lanka and Thailand. The BOBP also aims at improving information flow and promoting exchange of information on small-scale fisheries within the region.

The BOBP is funded by the Swedish International development Authority and executed by the Food and Agriculture Organization of the United Nations.
